

# HOG FUEL TRUCK LOAD OUT (1996)

Northern British Columbia, Canada

# SUMMARY

<b>KAMENGO FEEDERS:</b>	(1) Kamengo Feeder
<b>BIN STORAGE:</b>	17,000 cu-ft tall bin
<b>POWER:</b>	40HP Hydraulic Power Unit
<b>CAPACITY:</b>	Loads one truck trailer in 10 minutes
<b>PARTNERS:</b>	National Resources Canada

## HOG FUEL TRUCK LOAD OUT (1996)

Northern British Columbia, Canada

## SYSTEM OVERVIEW

Located at a sawmill in Northern British Columbia, this installation includes a 50-foot tall, 17,000 cu-ft double mass flow bin and Kamengo Feeder discharging hog fuel, shavings and chips into trucks. The Kamengo installation has shown to have several advantages over conventional truck load out systems such as clam shell bins, which suffer from material hang-ups and poorly controlled material discharge.

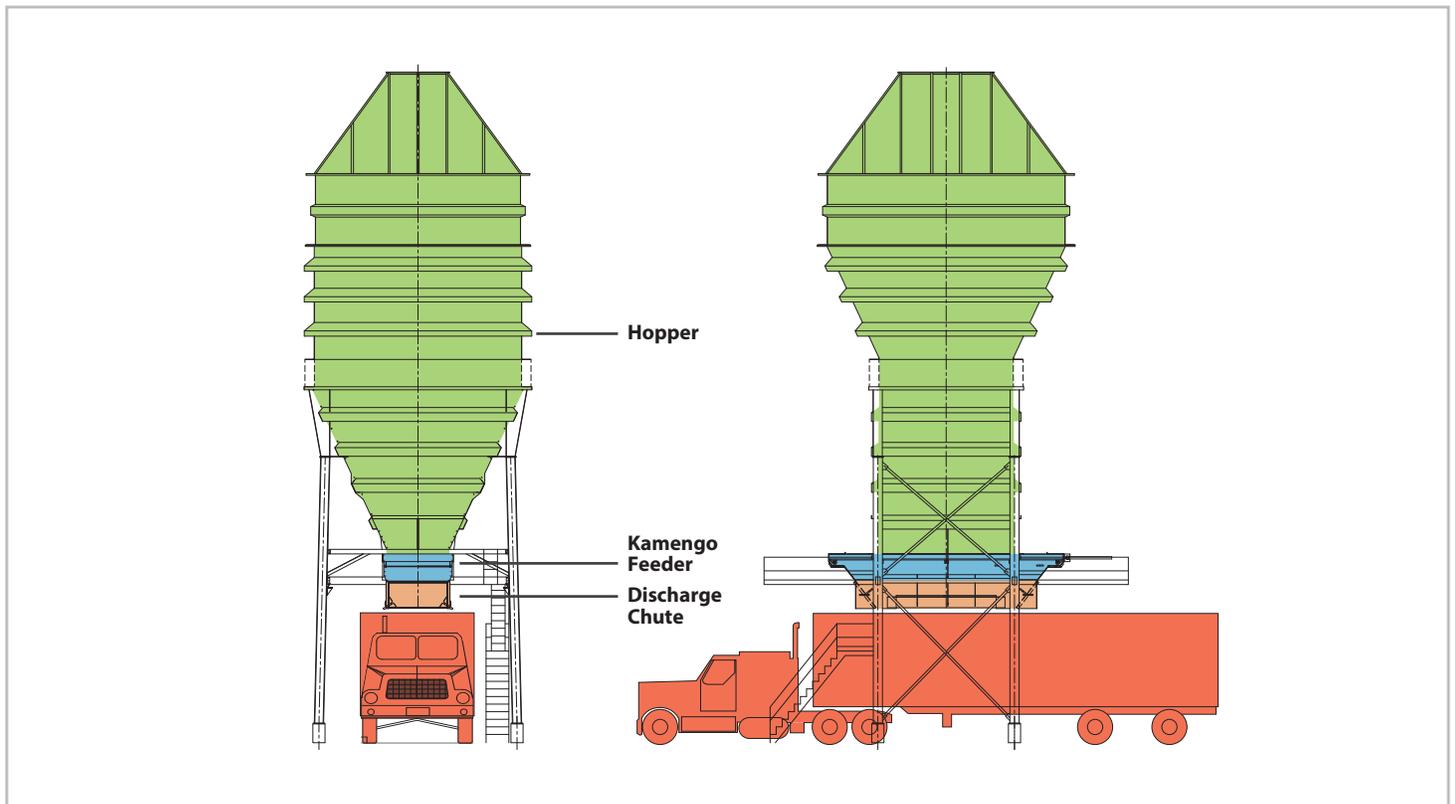

First, the Kamengo Feeder's even and controlled discharge is able to load up to 11% more material in the truck before it volumes-out. This is because the Feeder's smooth discharge better layers the material in the truck trailer without compressing it. With a Kamengo Feeder and tall bin, nine trucks are able to deliver the same load as that delivered by ten, producing significant transportation cost savings.

Second, the storage volume of the tall bin is equivalent to three conventional clam shell bins, delivering a large storage volume in a minimized footprint.

Third, the system has proven to be easy to use and efficient. The truck load out system is able to fill a standard 30-foot trailer in less than 15 minutes.

This installation has continued to deliver reliable performance with minimal required maintenance since it was put into service in 1996.

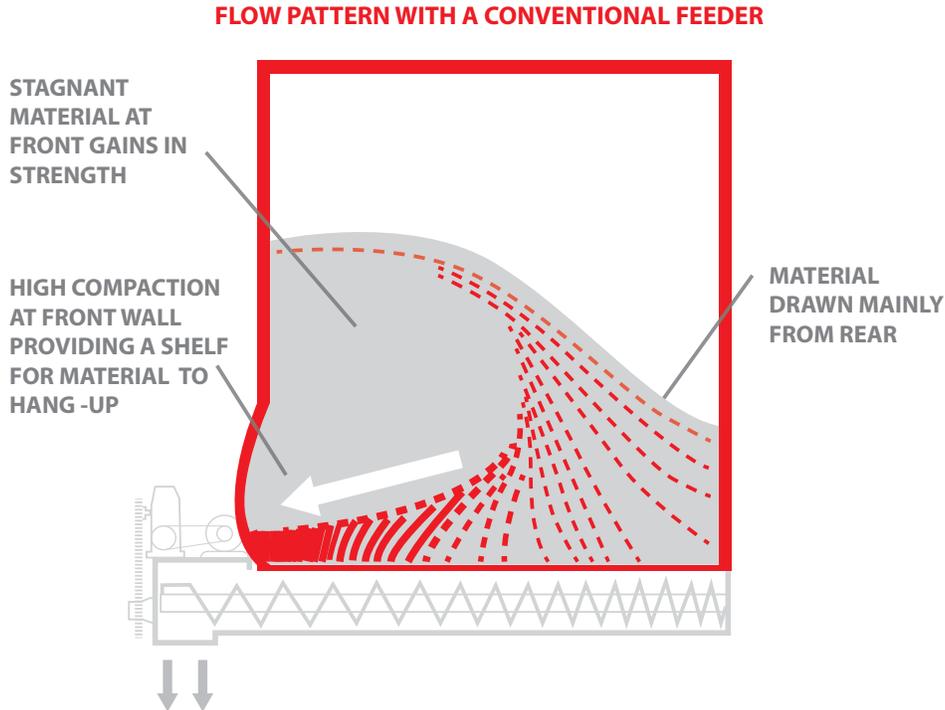

## SYSTEM LAYOUT

# WHY DO CONVENTIONAL FEEDERS PLUG?

## WHAT IS HAPPENING INSIDE THE BIN?

Most feeders draw material primarily from the rear of the bin, with little material drawn from the front. This problem is particularly severe when handling low bulk density fibrous materials. With fibrous materials, the pulling action of the feeder is felt well above in the bin, resulting in severe compaction, and in extreme cases, distortion of the front bin wall.

## POOR FLOW PATTERN RESULTS IN HANG-UPS

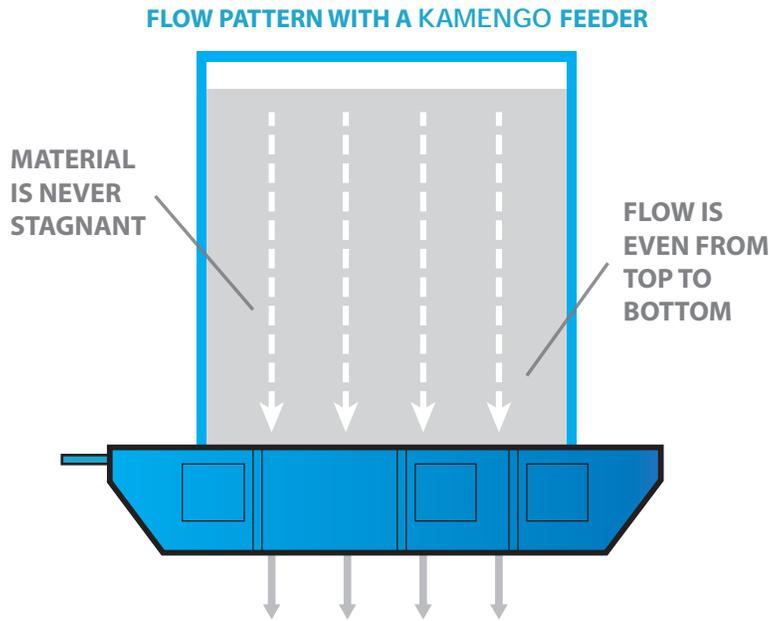

The compacted and stagnant material at the front of the bin is a major cause of bridging and hang-ups. Also, with material drawn mainly from a small section at the rear of the bin, live storage is greatly reduced, and stable rat-holes are permitted to form, resulting in dangerous bin hang-ups.

## PUTTING ENERGY TOWARDS THE WRONG PURPOSES

Most feeders withdraw material by developing a shear line at the hopper/feeder interface. This shearing action not only contributes to compaction of the stored material, but also results in excessive wear of mechanical parts.

# HOW IS THE KAMENGO FEEDER DIFFERENT?

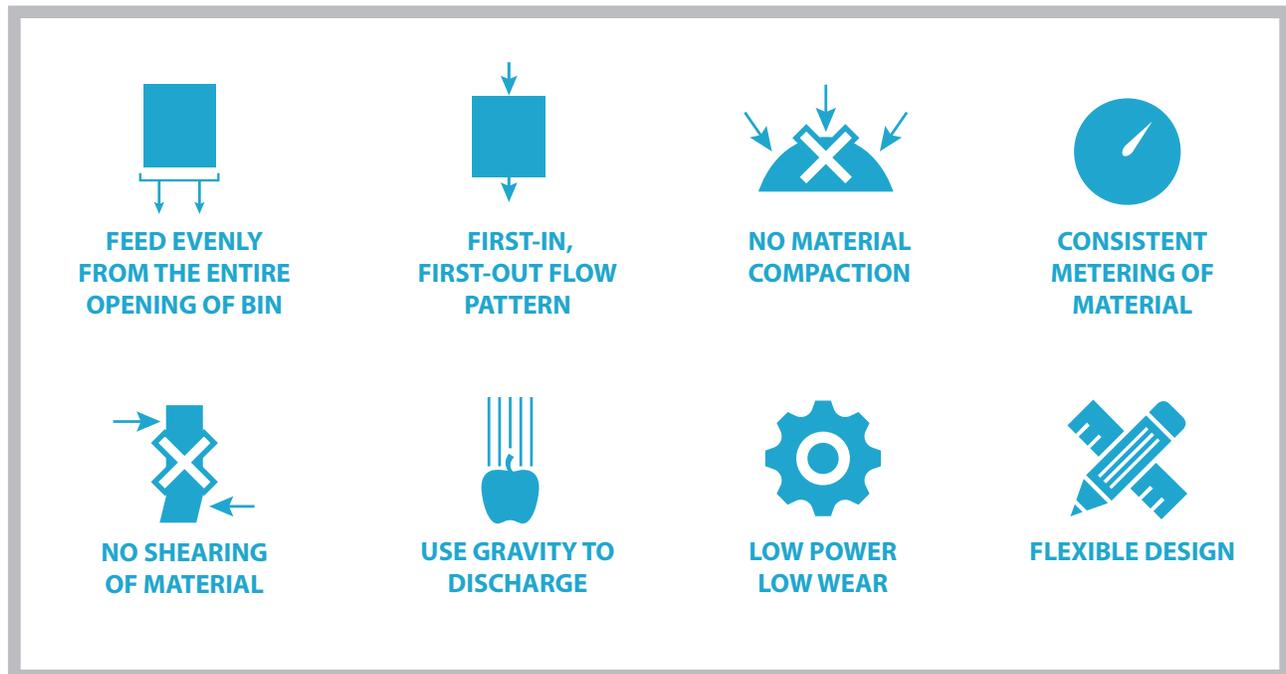

The Kamengo Feeder is different because it meters material evenly from the entire hopper outlet. With no stagnant pockets, the stored material is not afforded an opportunity to hang up.

Also, the Kamengo Feeder does not use brute force to extract material out of storage. Instead the Feeder relies on gravity and good bin geometry to reliably discharge the stored material. As such, the Feeder does not compact material, and thus allow it to gain strength and hang up. Also, because the Feeder does not put energy into shearing the material out of the bin, it requires far less power than a conventional feeder, saving energy and minimizing wear.

# KAMENGO SPECIALIZES IN THE STORAGE AND FEED OF DIFFICULT FLOWING BULK MATERIALS

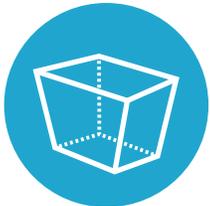

What makes Kamengo different is the tool kit we use to solve complex materials handling challenges:

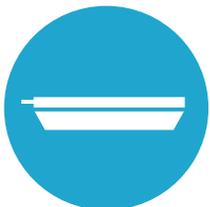

**Equipment To Characterize The Flow Properties Of Fibrous And Cohesive Materials**

In the 1980's Kamengo developed new testing equipment capable of characterizing the flow properties of stringy, fibrous and cohesive materials.

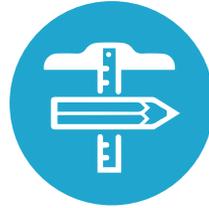

**Design Protocols To Determine Correct Bin, Feeder And Chute Geometry**

Kamengo has developed design protocols that use a material's flow properties to determine the bin, feeder and chute geometry required to promote reliable material flow. Correct equipment geometry will deny a stored material the conditions it needs to gain in strength and hang-up.

**The Kamengo Feeder: Proven Solution For Handling Difficult Flowing Materials**

The Kamengo Feeder resolves many of the shortcomings of conventional feeders. The Feeder withdraws material evenly from the full discharge opening of the hopper *and* does not compact stored material, resulting in a fully live bin. With installations running 24/7 for more than 20 years, the Kamengo Feeder has proven that it is a reliable solution for handling difficult flowing materials.

**The Kamengo Feeder: A Design Advantage**

The flow properties of difficult flowing materials often demand a fully live bin. A fully live bin is very difficult to achieve with a conventional feeder, but is easily achieved with a Kamengo Feeder.

**Skilled Design Practice**

Over the past 25 years, Kamengo has developed a design practice capable of tackling complex projects, including retrofits of storage and feed arrangements that suffer from plugging. Kamengo has the engineering capability to deliver complete packages of materials handling equipment including storage bins, feeders, chutes, structural work, and conveyors. We have delivered solutions for biomass, ore concentrates, fly and wet bottom ash, wood chips, pellets, and FGD gypsum.
